AIR QUALITY ANALYSIS IN TAMILNADU

Introduction:

- Air quality analysis in Tamil Nadu is a crucial field of study that assesses and monitors the state of the air in this South Indian state.
- It involves the collection, measurement, and interpretation of data related to air pollutants, meteorological conditions, and their impacts on public health and the environment.
- Key aspects of air quality analysis in Tamil Nadu include monitoring air pollutants like PM2.5, PM10, NO2, SO2, O3, and CO, as well as assessing factors like industrial emissions, vehicular pollution, weather patterns, and topography.
- The results of such analysis play a pivotal role in policy making, regulatory decisions, and public awareness campaigns aimed at improving air quality and safeguarding the well-being of the state's residents.

Given data set:

Stn Code	Sampling Date	State	City/Town/Villag	Location of Moni	Agency	Type of Location	SO2	NO2	RSPM/PM10	PM 2.5
38	01-02-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	11	17	55	NA
38	01-07-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	13	17	45	NA
38	21-01-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	12	18	50	NA
38	23-01-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	15	16	46	NA
38	28-01-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	13	14	42	NA
38	30-01-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	14	18	43	NA
38	02-04-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	12	17	51	NA
38	02-06-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	13	16	46	NA
38	02-11-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	10	19	50	NA
38	13-02-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	15	14	48	NA
38	18-02-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	14	16	32	NA
38	20-02-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	14	14	29	NA
38	25-02-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	13	17	17	NA
38	27-02-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	15	16	44	NA
38	03-04-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	12	17	25	NA
38	03-06-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	13	16	29	NA
38	03-11-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	11	18	29	NA
38	13-03-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	15	16	41	NA
38	18-03-14	Tamil Nadu	Chennai	Kathivakkam, Mu	Tamilnadu State	Industrial Area	14	17	43	NA

Steps to Follow:

1. Import Necessary Libraries:

python

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
from sklearn.preprocessing import MinMaxScaler
```

2. Load the Data set:

Load the data set into a Pandas Data frame,which is a tabular data structure,making it easy to work with for analysis.

```
import pandas as pd
# Replace dataset with the path to dataset file
df = pd.read_excel('dataset.excel')
```

3. Explore the Data set:

Explore the data set to understand its structure and quality.

python

```
print(dataset.head())  # Display the first few rows of the dataset
print(dataset.info())  # Get  information about the dataset
print(dataset.describe())  # Get summary statistics
```

4. **Handle Missing Values:**

Check for missing values in your dataset and decide how to handle them.

python

```
dataset.isna().sum()  # Check for missing values
```

5. **Data Processing:**

It may needs to process the data.

This can include:

- Encoding categorical variables.
- Scaling numerical features.

■ Loading the Data:

PROGRAM:

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
df.head()

df=pd.read_excel('/content/cpcb_dly_aq_tamil_nadu-2014 (1).xlsx')
```

```
df.head()
```

	Stn Code	Sampling Date	State	City/Town/Village/Area	Location of Monitoring Station	Agency	Type of Location	SO2	NO2	RSPM/PM10	PM 2.5

■ Data Processing:

✧ ONE -HOT SCALING:

i. Load the dataset:

```
[15] import numpy as np
     import pandas as pd
     import matplotlib.pyplot as plt
     %matplotlib inline
     import seaborn as sns
```

```
[18] dataset=pd.read_excel('/content/cpcb_dly_aq_tamil_nadu-2014 (1) (2).xlsx')
```

```
dataset.tail(5)
```

	Stn Code	Sampling Date	State	City/Town/Village/Area	Location of Monitoring Station	Agency	Type of Location	SO2	NO2	RSPM/PM10	PM 2.5
2874	773	2014-12-03 00:00:00	Tamil Nadu	Trichy	Central Bus Stand, Trichy	Tamilnadu State Pollution Control Board	Residential, Rural and other Areas	15.0	18.0	102.0	NaN
2875	773	2014-12-10 00:00:00	Tamil Nadu	Trichy	Central Bus Stand, Trichy	Tamilnadu State Pollution Control Board	Residential, Rural and other Areas	12.0	14.0	91.0	NaN
2876	773	17-12-14	Tamil Nadu	Trichy	Central Bus Stand, Trichy	Tamilnadu State Pollution Control Board	Residential, Rural and other Areas	19.0	22.0	100.0	NaN
2877	773	24-12-14	Tamil Nadu	Trichy	Central Bus Stand, Trichy	Tamilnadu State Pollution Control Board	Residential, Rural and other Areas	15.0	17.0	95.0	NaN

dataset.Agency.hist()
plt.xlabel('Agency')
plt.ylabel('Frequencies')
plt.plot()
```

■ Calculating the Air Quality Index:

➢ It involves a complex formula that considers the concentration of various air pollutants.

```python
def calculate_aqi(pm25, pm10):
    # Define AQI breakpoints and corresponding concentrations
    breakpoints = [0, 12, 35.4, 55.4, 150.4, 250.4, 350.4, 500.4]
    concentrations = [0, 12.1, 35.5, 55.5, 150.5, 250.5, 350.5, 500.5]

    # Calculate the AQI for PM2.5 and PM10
    aqi_pm25 = calculate_aqi_subindex(pm25, breakpoints, concentrations)
    aqi_pm10 = calculate_aqi_subindex(pm10, breakpoints, concentrations)

    # Return the higher AQI value
    return max(aqi_pm25, aqi_pm10)

def calculate_aqi_subindex(concentration, breakpoints, concentrations):
    # Find the appropriate AQI subindex
    for i in range(1, len(breakpoints)):
        if concentration <= concentrations[i]:
            aqi_low, aqi_high = breakpoints[i - 1], breakpoints[i]
            conc_low, conc_high = concentrations[i - 1], concentrations[i]
            aqi = ((aqi_high - aqi_low) / (conc_high - conc_low)) * (concentration - conc_low) + aqi_low
            return aqi

if __name__ == "__main__":
    pm25 = float(input("Enter the PM2.5 concentration (µg/m³): "))
    pm10 = float(input("Enter the PM10 concentration (µg/m³): "))

    aqi = calculate_aqi(pm25, pm10)
    print(f"The Air Quality Index (AQI) is {aqi}")
```

```
Enter the PM2.5 concentration (µg/m³): 0.0
Enter the PM10 concentration (µg/m³): 91.0
The Air Quality Index (AQI) is 90.9
```

■ Conclusion:

In conclusion,the loading and preprocessing of data for air quality are fundamental stages in the data analysis pipeline.These steps involve load,explore,check missing values and preprocess of given data.Data visualization and calculating the AQI has been done successfully.
